Message from the Guest Editors

Dear Colleagues,

Vector-borne diseases are a major issue in tropical countries. Global climate and landscape changes may be directly associated with territorial expansion and severe outbreaks of the neglected tropical diseases associated with different vector species. Mosquitos, phlebotomines, biting midges, ticks, lice, and fleas are amongst the main vector groups associated with tropical diseases dissemination. Integrated vector-borne disease control is compounded by several strategies. Studies about the biology and ecology of vector arthropods, detection of pathogenic agents, vectorial competence and capacity determination, population control, surveillance strategies and several other topics are of major importance for compounding a complete control approach, and studies on this subject must be encouraged.

Dr. Karin Kirchgatter

Aims and Scope

Insects (ISSN 2075-4450) is an international, peer-reviewed open access journal of entomology published by MDPI online quarterly. The journal publishes reviews, research papers, and communications related to the biology, physiology, and behavior of insects and arthropods.

Our aim is to encourage scientists to publish their experimental and theoretical results in as much detail as possible. There is no restriction on the length of the papers.

The scope of *Insects* includes, but is not limited to:

- molecular entomology
- applied entomology
- systematic entomology
- pest management
- biology, physiology, ecology and pathology of insects
- evolution of insects
- insects and plants interaction
- insects and public health
- insects and environment
